Package 'TOC'

June 1, 2015

Type Package

Title Total Operating Characteristic (TOC) Curve and ROC Curve

Version 0.0-2

Date 2015-06-02

Author Robert G. Pontius <rpontius@clarku.edu>, Alí Santacruz, Amin Tayyebi, Benoit Parmentier, Kangping Si

Maintainer Alí Santacruz <amsantac@unal.edu.co>

Depends R (>= 2.14.0), raster, bit, rgdal, methods

Description Construction of the Total Operating Characteristic (TOC) Curve and the Receiver (aka Relative) Operating Characteristic (ROC) Curve for spatial and non-spatial data.

License GPL (>= 2)

Encoding latin1

R topics documented:

`TOC-package` *Total Operating Characteristic (TOC) Curve and ROC Curve*

Description

Construction of the Total Operating Characteristic (TOC) Curve and the Receiver (aka Relative) Operating Characteristic (ROC) Curve for spatial and non-spatial data.

Details

Package:	TOC
Type:	Package
Version:	0.0-2
Date:	2015-06-02
License:	GPL (>= 2)
LazyLoad:	yes

Author(s)

Robert G. Pontius <rpontius@clarku.edu>, Alí Santacruz, Amin Tayyebi, Benoit Parmentier, Kangping Si

Maintainer: Alí Santacruz <amsantac@unal.edu.co>

TOC, plot

`plot` *Plot an object of class Toc or Roc*

Description

Plot a Total Operating Characteristic (TOC) curve or a Relative Operating Characteristic (ROC) curve

Usage

```
## S4 method for signature 'Toc'
plot(x, labelThres=FALSE, modelLeg="Model", digits=3, nticks=5, digitsL=1,
posL = NULL, offsetL = 0.5, ...)

## S4 method for signature 'Roc'
plot(x, labelThres=FALSE, modelLeg="Model", digits=3, nticks=5, digitsL=1,
posL = NULL, offsetL = 0.5, ...)
```

Arguments

`x`	An object of class Toc or Roc
`labelThres`	logical, default to FALSE. If TRUE, thresholds are labeled in the TOC plot
`modelLeg`	a character string for labeling the model in the legend
`digits`	integer indicating the number of decimal places (round) or significant digits (signif) to be used for labeling the numeric axes. Negative values are allowed. See Details in the `round` function
`nticks`	number of tickmarcks to be drawn along the axes

digitsL	integer indicating the number of decimal places (round) or significant digits (signif) to be used for labeling the thresholds. Negative values are allowed. See Details in the round function
posL	a position specifier for the text labels. Values of 1, 2, 3 and 4, respectively indicate positions below, to the left of, above and to the right of the corresponding coordinates
offsetL	when posL is specified, this value gives the offset of the label from the corresponding coordinate in fractions of a character width
...	additional parameters to be passed to plot, axis or text

Value

a plot showing the TOC or the ROC curves

See Also

TOC, ROC

Examples

```
index <- raster(system.file("external/Prob_Map2.rst", package = "TOC"))
boolean <- raster(system.file("external/Change_Map2b.rst", package = "TOC"))
mask <- raster(system.file("external/MASK4.rst", package="TOC"))
tocd <- TOC(index, boolean, mask, nthres = 100)
plot(tocd, main = "TOC curve")
rocd <- ROC(index, boolean, mask, nthres = 100)
plot(rocd, main = "ROC curve")

# label the thresholds in the plot
tocd <- TOC(index, boolean, mask, nthres = 10)
plot(tocd, labelThres = TRUE, cex = 0.8, posL = 4)
```

ROC *Construct the table for the ROC curve*

Description

Construct the table for the Relative Operating Characteristic (ROC) curve for spatial or non-spatial data

Usage

```
## S4 method for signature 'numeric,numeric'
ROC(index, boolean, mask=NULL, nthres=NULL, thres=NULL, NAval=0, progress=FALSE)

## S4 method for signature 'RasterLayer,RasterLayer'
ROC(index, boolean, mask=NULL, nthres=NULL, thres=NULL, NAval=0, progress=FALSE)
```

Arguments

index	index object of class numeric or RasterLayer
boolean	boolean object of class numeric or RasterLayer
mask	mask object of class numeric or RasterLayer
nthres	an optional integer indicating the number of equal-interval thresholds to be evaluated for the ROC curve. See Details below
thres	an optional numeric vector of thresholds to be evaluated for the ROC curve. See Details below
NAval	value for nodata (NA values) in the mask object
progress	logical; if TRUE, a progress bar is shown

Details

thresholds are calculated as the unique values of the index object after masking out NA values (default option), if neither nthres nor thres is provided. The default option can be time-consuming if the amount of unique values in the index object (after masking out NA values) is large (e.g., > 1000). In the latter case, the user may prefer to enter specified thresholds (with the `thres` argument), or to indicate the number of equal-interval thresholds to be evaluated for the ROC curve (with the `nthres` argument)

Value

an object of class `Roc` containing the ROC table, the area under the curve (AUC), maximum AUC and minimum AUC

See Also

plot

Examples

```
index <- raster(system.file("external/Prob_Map2.rst", package = "TOC"))
boolean <- raster(system.file("external/Change_Map2b.rst", package = "TOC"))
mask <- raster(system.file("external/MASK4.rst", package = "TOC"))

# thresholds can also be defined by indicating the number of equal-interval thresholds
rocd <- ROC(index, boolean, mask, nthres = 100)
rocd

# a vector of thresholds can be used to define the thresholds
thresholds <- seq(min(unique(index)), max(unique(index)) + 1,
                  by = ceiling(max(unique(index))/10))
rocd <- ROC(index, boolean, mask, thres = thresholds)
rocd

## Not run:
# generate the ROC curve using non-spatial data (i.e., numeric vectors)
index <- getValues(index)
boolean <- getValues(boolean)
mask <- getValues(mask)
rocd <- ROC(index, boolean, mask, nthres = 100)

## End(Not run)
```

roctable *Construct a basic ROC table*

Description

TOC internal function. Construct a basic ROC table

Usage

```
roctable(indval, boolval, maskval=NULL, nthres=NULL, thres=NULL, NAval=0,
         progress=FALSE, ones.bool=NULL, zeros.bool=NULL)
```

Arguments

indval	numeric index vector
boolval	numeric boolean vector
maskval	numeric mask vector
nthres	an optional integer indicating the number of equal-interval thresholds to be evaluated for the TOC curve. See Details below
thres	an optional numeric vector of thresholds to be evaluated for the TOC curve. See Details below
NAval	value for nodata (NA values) in the mask map
progress	logical; if TRUE, a progress bar is shown
ones.bool	numeric value indicating total number of 1's in the boolean vector
zeros.bool	numeric value indicating total number of 0's in the boolean vector

Value

a data.frame with a basic ROC table and a numeric value for minimum value in the index vector

Note

This function is not meant to be called by users directly

scaling *scale the output TOC values and change units*

Description

scale the 'Hits' and 'Hits+FalseAlarms' values in the TOC output table, as well as the prevalence and population, using a scaling factor. Labels for the modified units in the TOC object are changed to newUnits

Usage

```
## S4 method for signature 'Toc'
scaling(x, scalingFactor, newUnits)
```

Arguments

x	an object of class Toc
scalingFactor	numeric value to scale 'Hits' and 'Hits+FalseAlarms' values in the TOC output table, as well as the prevalence and population
newUnits	charater string for the new data units in the TOC object

Value

an object of class TOC

See Also

TOC, ROC

Examples

```
index <- raster(system.file("external/Prob_Map2.rst", package = "TOC"))
boolean <- raster(system.file("external/Change_Map2b.rst", package = "TOC"))
mask <- raster(system.file("external/MASK4.rst", package = "TOC"))
tocd <- TOC(index, boolean, mask, nthres = 100)
plot(tocd)

# scale units from square m to square km
tocd_sqkm <- scaling(tocd, scalingFactor = 1000000, newUnits = "square km")
plot(tocd_sqkm)
```

TOC *Construct the table for the TOC curve*

Description

Construct the table for the Total Operating Characteristic (TOC) curve for spatial or non-spatial data

Usage

```
## S4 method for signature 'numeric,numeric'
TOC(index, boolean, mask=NULL, nthres=NULL, thres=NULL, NAval=0, P=NA, Q=NA,
progress=FALSE, units=character(0))
## S4 method for signature 'RasterLayer,RasterLayer'
TOC(index, boolean, mask=NULL, nthres=NULL, thres=NULL, NAval=0, P=NA, Q=NA,
    progress=FALSE)
```

Arguments

index	index object of class numeric or RasterLayer
boolean	boolean object of class numeric or RasterLayer
mask	mask object of class numeric or RasterLayer
nthres	an optional integer indicating the number of equal-interval thresholds to be evaluated for the TOC curve. See Details below

thres	an optional numeric vector of thresholds to be evaluated for the TOC curve. See Details below
NAval	value for nodata (NA values) in the mask object
P	count of reference presence observations in the population
Q	count of reference absence observations in the population
progress	logical; if TRUE, a progress bar is shown
units	character string indicating data units

Details

thresholds are calculated as the unique values of the index object after masking out NA values (default option), if neither nthres nor thres is provided. The default option can be time-consuming if the amount of unique values in the index object (after masking out NA values) is large (e.g., > 1000). In the latter case, the user may prefer to enter specified thresholds (with the thres argument), or to indicate the number of equal-interval thresholds to be evaluated for the TOC curve (with the nthres argument)

Value

an object of class Toc containing the TOC table, the area under the curve (AUC), maximum AUC and minimum AUC, the prevalence, the population and the data units (for data in the TOC table slot, and the prevalence and population slots)

See Also

plot

Examples

```
index <- raster(system.file("external/Prob_Map2.rst", package = "TOC"))
boolean <- raster(system.file("external/Change_Map2b.rst", package = "TOC"))
mask <- raster(system.file("external/MASK4.rst", package = "TOC"))

# thresholds can also be defined by indicating the number of equal-interval thresholds
tocd <- TOC(index, boolean, mask, nthres = 100)
tocd

# A vector of thresholds can be used to define the thresholds
thresholds <- seq(min(unique(index)), max(unique(index)) + 1,
                  by = ceiling(max(unique(index))/10))
tocd <- TOC(index, boolean, mask, thres = thresholds)
tocd

## Not run:
# generate the TOC curve using non-spatial data (i.e., numeric vectors)
index <- getValues(index)
boolean <- getValues(boolean)
mask <- getValues(mask)
tocd <- TOC(index, boolean, mask, nthres = 100)

## End(Not run)
```

Toc-class *Toc and Roc classes*

Description

Toc and Roc classes

Objects from the Class

Objects can be created by calls of the form `new("Toc", ...)`, or with the helper functions such as `Toc`.

Slots

Slots for Roc and Toc objects

`table`: data.frame

`AUC`: numeric; Area Under the Curve

`maxAUC`: numeric; maximum AUC

`minAUC`: numeric; minimum AUC

`prevalence`: numeric; prevalence

`population`: numeric; population

`units`: character; units for data in the TOC table, prevalence and population

Examples

```
showClass("Toc")
```

uncertainty *Uncertainty in AUC calculation*

Description

TOC internal function. It calculates uncertainty in AUC calculation

Usage

```
uncertainty(index, tocd)
```

Arguments

`index`	index vector
`tocd`	data.frame output from `roctable`

Value

a numeric value representing uncertainty in AUC calculation

Note

This function is not meant to be called by users directly

Index
